More ways to eat. More ways to earn.

Homemade sattu, sweets, pickles and other products now have a delivery-time agreement flow. Breakfast, lunch and light dinner support one-time meals and separate 3-7-day plans.

Service windows - India time

Breakfast: 06:00-10:59. Lunch: 11:00-16:59. Light dinner: 17:00-21:00.

New courier pickup/departure steps close at 20:30. Every new delivery slot includes at least 30 minutes of travel allowance.

These are scheduling limits, not a road-traffic arrival guarantee. Actual late delivery is still recorded and flagged.

Status: implementation and isolated local QA completed. Physical neighbourhood UAT remains required. No new Android APK is included in this release; the shared web app screens are updated.

Publish a Mother Kitchen product

01 Sign in as a mother and open Marketplace. An active account, approved mother and kitchen, and open kitchen are required for public selling.

02 Enter name, description, category and diet. Choose Sattu, Sweets, Pickles or Other.

03 Choose a whole pack/unit: e.g. 500 g pack or 1 kg. Set price per unit, stock and minimum units. A request supports up to 100 units.

04 Choose Ready batch or Made to order. A ready batch requires a future expiry. Made-to-order items declare minimum preparation minutes.

05 Record ingredients, allergens, storage instructions and shelf life. These are seller declarations, not a food-safety certification.

06 Save, then check the listing. After approval/opening, save any draft again to publish. Pause unavailable stock or edit it using the latest inventory state.

Respond to a request

Accept the preferred time or propose another valid IST time. A customer counter-proposal returns the request for your review. Review requests expire after 48 hours; an agreed offer requires checkout within 30 minutes.

Stock is not held during negotiation. A change to price, ingredients, allergens or other agreed terms requires a new request. Never promise a delivery your preparation and route cannot support.

Meals are still published separately

Choose Breakfast, Lunch or Dinner when publishing a dated menu. Lunch requires three components. Breakfast and light dinner allow one to three. Existing meal-tier pricing remains; product pack prices are set separately.

Agree a time. Then place the order.

01 Save a default delivery address with the correct location pin. Nearby products are matched to city and the kitchen service radius.

02 Open Marketplace, search or filter products, and review pack, price, stock, ingredients and allergens.

03 Choose whole units and a preferred IST date/time within seven days. Preparation time plus a 30-minute travel buffer must fit. Ready batches must arrive before expiry.

04 Press Request delivery time. No stock or wallet amount is taken yet.

05 Review the mother's acceptance or proposed time. Accept it or counter-propose.

06 Once the kitchen agrees, press Confirm time & place order within 30 minutes. Stock and available wallet credit are applied once. Any remaining balance stays due; this request flow does not initiate a bank charge.

07 Open Orders on your dashboard. The confirmed product purchase follows normal kitchen preparation, courier handover, tracking and separate food/delivery feedback.

One-time meal or subscription

Open a nearby kitchen, choose a meal period and press Order meal for one date. For a plan, select 3-7 distinct dates within one week and one meal period. Multiple portions on one date still count as one day. Create separate breakfast, lunch or dinner plans. Renewal is manual.

The system rechecks stock, account access, address, expiry and agreed terms at final checkout. Repeated confirmation cannot create another order or debit.

One shared order lifecycle

Kitchen to customer

The mother marks the confirmed order Preparing, then Ready. An approved courier claims the task, starts consent-based location sharing and follows the existing pickup/drop-off checks. Customer tracking is linked to that order. GPS test points are not evidence of a physical route.

Admin oversight

Admin Marketplace shows the latest 100 products and 60 time requests. Linked purchases also appear in Orders and Earnings. Existing role protection remains. Product requests retain versioned negotiation history and a snapshot of the agreed product terms.

Cancellation rules

Customer: before preparation and at least five hours before delivery, the existing eligible paid value less Rs 5 returns to wallet. Unprepared capacity is released. A paused menu stays paused.

Kitchen: collected wallet spend returns in full without a customer processing fee. Unprepared stock is restored. Prepared or returned food is never automatically relisted as fresh food.

Gateway payments: cases needing operations refund review keep that review path. Wallet ledger credit is not a bank payout or proof of cash income.

Data and delivery boundaries

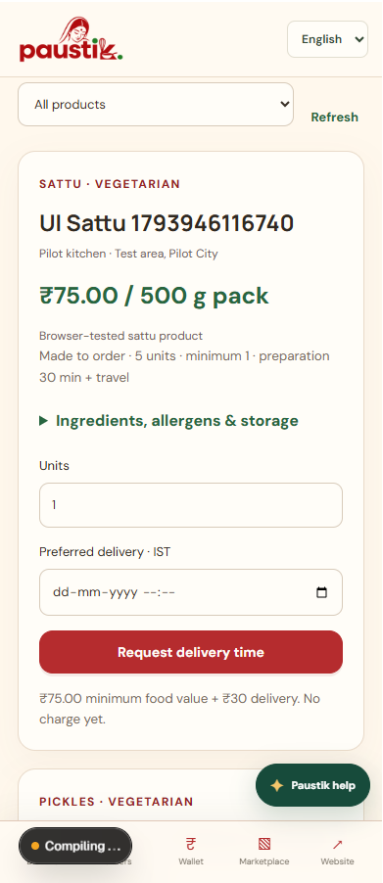

FoodProduct stores listing details. ProductRequest stores quantity, quoted terms, address, history, expiry and final order. Checkout creates ordinary Order, OrderItem, wallet, notification and event records transactionally. Existing delivery and ratings use the same order ID.

Outside this release: national shipping, fractional-weight checkout, product replenishment subscriptions, automatic bank payouts and dynamic road ETA.

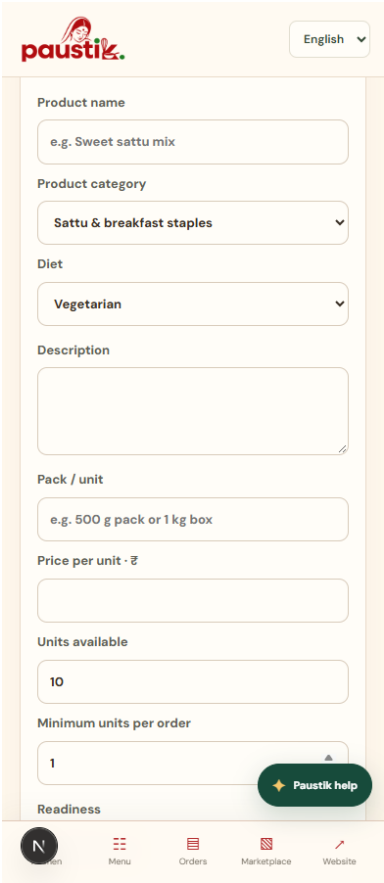

CAPTURED LOCAL TEST SCREENS

What testers will see

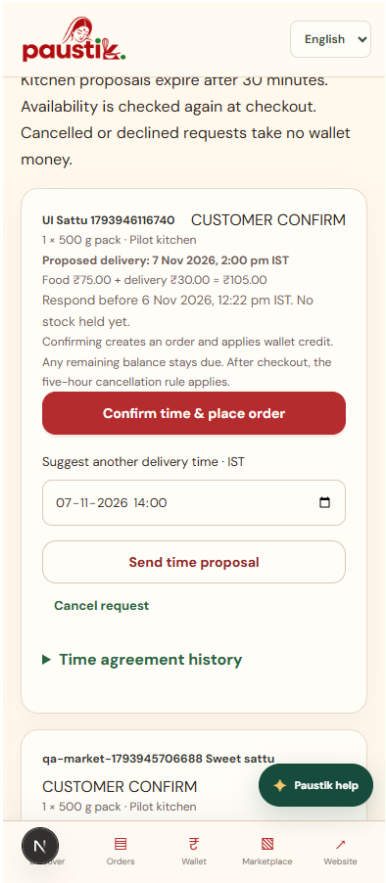

Synthetic accounts and products in the isolated preview. Full captures are available in the protected Admin test-evidence gallery. These are not real partner or customer records.

Customer: nearby products and time request

Mother: product details, stock and readiness

Customer: delivery agreement before checkout

Agile acceptance map

MK-01/02: own-kitchen publishing and nearby eligible discovery.

MK-03/04: time negotiation, expiry, stale-version protection, atomic stock and idempotent checkout.

ML-01/02: one-time meals and 3-7-day single-period subscriptions.

OP-01/02/03: safe stock release, 21:00 delivery policy, shared admin records.

QA-01: previous wallet, role, tracking, feedback and language regression retained.

QA results and pilot sign-off

94/94 unit tests passed. TypeScript and targeted lint passed. Nine marketplace/API/browser scenario groups and the previous eight-group meal-order regression passed locally. No page errors occurred in the captured role journeys; mobile 390 px and admin 1440 px had no overflow.

PASS - Product creation, nearby discovery and browser publishing form.

PASS - Full negotiation, counter-proposal, stale-version rejection and duplicate checkout.

PASS - Kitchen cancellation, wallet refund and unprepared capacity restoration.

PASS - Expiry, bulk minimum, invalid late slots and expired requests reject without payment.

PASS - Last-unit concurrent checkout has one winner; losing wallet is unchanged.

PASS - Changed allergens reject old quotes; stale inventory edits cannot overwrite new stock.

PASS - Breakfast order/plan and dinner boundary; mixed-period/one-day plans reject; pauses preserved.

PASS - Shared product preparation, courier claim, simulated GPS, delivery and feedback.

PASS - Browser checkout returns to the customer Orders section.

Before your first real neighbourhood delivery

Assign an owner and record expected/actual results for: real kitchen approval and food handling; accurate customer address; physical-phone GPS; consented push/email/SMS/WhatsApp receipt; real collection/refund reconciliation; courier handover, food condition and route arrival time.

Begin with one approved kitchen, one service slot and a small consenting group. Keep test wallets and synthetic listings separate. Actual food, physical GPS, real messaging, live payments and bank payouts were not validated by these local tests.

UAT record: date, role/account, scenario, expected result, actual result, evidence, severity, owner and retest outcome. Founder sign-off should follow a successful physical meal and product delivery.
